

NAME

git-credential-cache--daemon - Temporarily store user credentials in memory

SYNOPSIS

git credential-cache—daemon <socket>

DESCRIPTION**Note**

You probably don't want to invoke this command yourself; it is started automatically when you use [git-credential-cache\(1\)](#).

This command listens on the Unix domain socket specified by <socket> for git-credential-cache clients. Clients may store and retrieve credentials. Each credential is held for a timeout specified by the client; once no credentials are held, the daemon exits.
