

NAME

git-mailsplit - Simple UNIX mbox splitter program

SYNOPSIS

git mailsplit [-b] [-f<nn>] [-d<prec>] [--keep-cr] -o<directory> [--] [(<mbox>|<Maildir>)...]

DESCRIPTION

Splits a mbox file or a Maildir into a list of files: 0001 0002 .. in the specified directory so you can process them further from there.

Important

Maildir splitting relies upon filenames being sorted to output patches in the correct order.

OPTIONS

<mbox>

Mbox file to split. If not given, the mbox is read from the standard input.

<Maildir>

Root of the Maildir to split. This directory should contain the cur, tmp and new subdirectories.

-o<directory>

Directory in which to place the individual messages.

-b

If any file doesn't begin with a From line, assume it is a single mail message instead of signaling error.

-d<prec>

Instead of the default 4 digits with leading zeros, different precision can be specified for the generated filenames.

-f<nn>

Skip the first <nn> numbers, for example if -f3 is specified, start the numbering with 0004.

--keep-cr

Do not remove r from lines ending with rn.
