

NAME

git-whatchanged - Show logs with difference each commit introduces

SYNOPSIS

git whatchanged <option>...

DESCRIPTION

Shows commit logs and diff output each commit introduces.

New users are encouraged to use [git-log\(1\)](#) instead. The whatchanged command is essentially the same as [git-log\(1\)](#) but defaults to show the raw format diff output and to skip merges.

The command is kept primarily for historical reasons; fingers of many people who learned Git long before git log was invented by reading Linux kernel mailing list are trained to type it.

EXAMPLES

```
git whatchanged -p v2.6.12.. include/scsi drivers/scsi
```

Show as patches the commits since version *v2.6.12* that changed any file in the include/scsi or drivers/scsi subdirectories

```
git whatchanged --since=2 weeks ago -- gitk
```

Show the changes during the last two weeks to the file *gitk*. The -- is necessary to avoid confusion with the **branch** named *gitk*

GIT

Part of the [git\(1\)](#) suite
