

NAME

lookbib - search bibliographic databases

SYNOPSIS

lookbib [**-v**] [**-istring**] [**-tn**] *filename*...

DESCRIPTION

lookbib prints a prompt on the standard error (unless the standard input is not a terminal), reads from the standard input a line containing a set of keywords, searches the bibliographic databases *filename*... for references containing those keywords, prints any references found on the standard output, and repeats this process until the end of input. For each database *filename* to be searched, if an index *filename.i* created by [indxbib\(1\)](#) exists, then it will be searched instead; each index can cover multiple databases.

OPTIONS

It is possible to have whitespace between a command line option and its parameter.

-v Print the version number.

-istring

When searching files for which no index exists, ignore the contents of fields whose names are in *string*.

-tn Only require the first *n* characters of keys to be given. Initially *n* is 6.

FILES

filename.i Index files.
