

**NAME**

myisamlog - display MyISAM log file contents

**SYNOPSIS**

**myisamlog** [*options*] [*log\_file* [*tbl\_name*] ...]

**DESCRIPTION**

**myisamlog** processes the contents of a MyISAM log file. To create such a file, start the server with a **--log-isam=log\_file** option.

Invoke **myisamlog** like this:

```
shell> myisamlog [options] [file_name [tbl_name] ...]
```

The default operation is update (**-u**). If a recovery is done (**-r**), all writes and possibly updates and deletes are done and errors are only counted. The default log file name is myisam.log if no *log\_file* argument is given. If tables are named on the command line, only those tables are updated.

**myisamlog** supports the following options:

- **-?**, **-I**  
Display a help message and exit.
- **-c** *N*  
Execute only *N* commands.
- **-f** *N*  
Specify the maximum number of open files.
- **-F** *filepath/*  
Specify the file path with a trailing slash.
- **-i**  
Display extra information before exiting.
- **-o** *offset*  
Specify the starting offset.
- **-p** *N*  
Remove *N* components from path.
- **-r**  
Perform a recovery operation.
- **-R** *record\_pos\_file record\_pos*  
Specify record position file and record position.
- **-u**  
Perform an update operation.
- **-v**  
Verbose mode. Print more output about what the program does. This option can be given multiple times to produce more and more output.
- **-w** *write\_file*  
Specify the write file.
- **-V**  
Display version information.
