

NAME

openbox — A minimalistic, highly configurable, next generation window manager with extensive standards support.

SYNOPSIS

openbox [--help] [--display DISPLAY] [--id ID] [--root] [--] [PROPERTY ...]

DESCRIPTION

obxprop is a tool for displaying the properties on an x window.

This tool has a similar functionality to **xprop**, but obxprop allows you to see UTF-8 strings as text.

You may use the **--id** option to specify a window identifier, otherwise obxprop will allow you to select a window by clicking on it.

Primarily, this tool exists for Openbox users to see the value of the `_OB_APP_NAME`, `_OB_APP_CLASS`, `_OB_APP_ROLE`, and `_OB_APP_TYPE` properties, which Openbox uses for matching windows against user-defined application rules.

OPTIONS

These are the possible options that **openbox** accepts:

--help Show a summary of the options available.

--display DISPLAY
Specify the X display to use.

--id ID Specify the window identifier for the window whose properties will be displayed.

Similar to **xprop**, you may pass one or more property names to have **openbox** limit its output to only the properties requested.
