

NAME

`openbox-session` — Runs an Openbox session without any session manager.

DESCRIPTION

openbox-session runs an openbox session without any session manager. Without a session manager, you will not be able to save your state from one log in to the next.

openbox-session does not take any command line arguments.

On log in, **openbox-session** will run the `~/config/openbox/autostart` script if it exists, and will run the system-wide script `/etc/xdg/openbox/autostart` otherwise. You may place anything you want to run automatically in those files, for example:

```
xsetroot -solid grey &  
gnome-settings-daemon &
```

Make sure that each line is followed by a "&" or else the script will stop there and further commands will not be executed. You can use the `/etc/xdg/openbox/autostart` file as an example for creating your own.
