

**NAME**

roff2x - transform roff code into x mode

**SYNOPSIS**

**roff2x** [ *groffer\_option* ... ] [--] [ *filespec* ... ]

**roff2x -h|--help**

**roff2x -v|--version**

The options **-v** and **--version** print the version information of the program to standard output and exit. The options **-h** and **--help** print a usage information of the program to standard output and stop the program instantly.

All other options are assumed to be **groffer** options. They are internally passed to **groffer**. They override the behavior of the program. The options are optional, they can be omitted.

The *filespec* arguments correspond to the *filespec* arguments of **groffer**. So they are either the names of existing, readable files or - for standard input, or the name of a man page or a [groffer\(1\)](#) man page search pattern. If *nofilespec* is specified standard input is assumed automatically.

**DESCRIPTION**

**roff2x** transforms *roff* code into *X* mode corresponding to the *groff* devices **X\***; this mode is suitable for [gxditview\(1\)](#). Print the result to standard output.

There are more of these programs for generating other formats of *roff* input.

[roff2dvi\(1\)](#) is for *dvi* mode.

[roff2html\(1\)](#) generates *html* output.

[roff2pdf\(1\)](#) outputs *pdf* mode.

[roff2ps\(1\)](#) prints *PostScript* format to standard output.

[roff2text\(1\)](#) generates text output in the **groff** device *latin1*.
