

NAME

Dpkg::BuildEnv - track build environment

DESCRIPTION

The Dpkg::BuildEnv module is used by dpkg-buildflags to track the build environment variables being used and modified.

FUNCTIONS

`$bf->set($varname, $value)`

Update the build environment variable `$varname` with value `$value`. Record it as being accessed and modified.

`$bf->get($varname)`

Get the build environment variable `$varname` value. Record it as being accessed.

`$bf->has($varname)`

Return a boolean indicating whether the environment variable exists. Record it as being accessed.

`my @list = $bf->list_accessed()`

Returns a list of all environment variables that have been accessed.

`my @list = $bf->list_modified()`

Returns a list of all environment variables that have been modified.

CHANGES**Version 0.xx**

This is a private module.
