

NAME

Dpkg::Gettext - convenience wrapper around Locale::gettext

DESCRIPTION

The Dpkg::Gettext module is a convenience wrapper over the Locale::gettext module, to guarantee we always have working gettext functions, and to add some commonly used aliases.

FUNCTIONS

```
my $trans = _g($msgid)
```

Calls *gettext()* on the `$msgid` and returns its translation for the current locale. If *gettext()* is not available, simply returns `$msgid`.

```
my $trans = P_($msgid, $msgid_plural, $n)
```

Calls *gettext()*, returning the correct translation for the plural form dependent on `$n`. If *gettext()* is not available, returns `$msgid` if `$n` is 1 or `$msgid_plural` otherwise.

CHANGES**Version 1.00**

Mark the module as public.
