NAME

atanh, atanhf, atanhl - inverse hyperbolic tangent function

SYNOPSIS

```
#include <math.h>
    double atanh(double x);
    float atanhf(float x);
    long double atanhl(long double x);
    Link with -lm.

Feature Test Macro Requirements for glibc (see feature_test_macros(7)):
    atanh():
        _BSD_SOURCE || _SVID_SOURCE || _XOPEN_SOURCE >= 500 ||
        _XOPEN_SOURCE && _XOPEN_SOURCE_EXTENDED || _ISOC99_SOURCE ||
        _POSIX_C_SOURCE >= 200112L;
        or cc -std=c99
    atanhf(), atanhl():
        _BSD_SOURCE || _SVID_SOURCE || _XOPEN_SOURCE >= 600 || _ISOC99_SOURCE ||
        _POSIX_C_SOURCE >= 200112L;
```

DESCRIPTION

The atanh() function calculates the inverse hyperbolic tangent of x; that is the value whose hyperbolic tangent is x.

RETURN VALUE

On success, these functions return the inverse hyperbolic tangent of x.

If x is a NaN, a NaN is returned.

or cc -std=c99

If x is +0 (-0), +0 (-0) is returned.

If x is +1 or -1, a pole error occurs, and the functions return $\mathbf{HUGE_VAL}$, $\mathbf{HUGE_VALF}$, or $\mathbf{HUGE_VALL}$, respectively, with the mathematically correct sign.

If the absolute value of x is greater than 1, a domain error occurs, and a NaN is returned.

ERRORS

See math_error(7) for information on how to determine whether an error has occurred when calling these functions.

The following errors can occur:

```
Domain error: x less than -1 or greater than +1
```

errno is set to EDOM. An invalid floating-point exception (FE_INVALID) is raised.

Pole error: x is +1 or -1

errno is set to **ERANGE** (but see BUGS). A divide-by-zero floating-point exception (**FE_DIVBYZERO**) is raised.

CONFORMING TO

C99, POSIX.1-2001. The variant returning double also conforms to SVr4, 4.3BSD, C89.

BUGS

In glibc 2.9 and earlier, when a pole error occurs, *errno* as set to **EDOM** instead of the POSIX-mandated **ERANGE**. Since version 2.10, glibc does the right thing.
