NAME

mcheck, mcheck check all, mcheck pedantic, mprobe - heap consistency checking

SYNOPSIS

```
#include <mcheck.h>
int mcheck(void (*abortfunc)(enum mcheck_status mstatus));
int mcheck_pedantic(void (*abortfunc)(enum mcheck_status mstatus));
void mcheck_check_all(void);
enum mcheck status mprobe(void *ptr);
```

DESCRIPTION

The **mcheck**() function installs a set of debugging hooks for the malloc(3) family of memory-allocation functions. These hooks cause certain consistency checks to be performed on the state of the heap. The checks can detect application errors such as freeing a block of memory more than once or corrupting the bookkeeping data structures that immediately precede a block of allocated memory.

To be effective, the **mcheck**() function must be called before the first call to **malloc(3)** or a related function. In cases where this is difficult to ensure, linking the program with *-lmcheck* inserts an implicit call to **mcheck**() (with a NULL argument) before the first call to a memory-allocation function.

The mcheck_pedantic() function is similar to mcheck(), but performs checks on all allocated blocks whenever one of the memory-allocation functions is called. This can be very slow!

The mcheck_check_all() function causes an immediate check on all allocated blocks. This call is effective only if mcheck() is called beforehand.

If the system detects an inconsistency in the heap, the caller-supplied function pointed to by abortfunc is invoked with a single argument argument, mstatus, that indicates what type of inconsistency was detected. If abortfunc is NULL, a default function prints an error message on stderr and calls abort(3).

The $\mathbf{mprobe}()$ function performs a consistency check on the block of allocated memory pointed to by ptr. Themc $\mathbf{heck}()$ function should be called beforehand (otherwise $\mathbf{mprobe}()$ returns $\mathbf{MCHECK\ DISABLED})$.

The following list describes the values returned by $\mathbf{mprobe}()$ or passed as the *mstatus* argument when *abortfunc* is invoked:

MCHECK DISABLED (mprobe() only)

mcheck() was not called before the first memory allocation function was called. Consistency checking is not possible.

MCHECK OK (mprobe() only)

No inconsistency detected.

MCHECK HEAD

Memory preceding an allocated block was clobbered.

MCHECK TAIL

Memory following an allocated block was clobbered.

MCHECK FREE

A block of memory was freed twice.

RETURN VALUE

mcheck() and mcheck pedantic() return 0 on success, or -1 on error.

VERSIONS

The mcheck_pedantic() and mcheck_check_all() functions are available since glibc 2.2. The mcheck() and mprobe() functions are present since at least glibc 2.0

CONFORMING TO

These functions are GNU extensions.

NOTES

Linking a program with *-lmcheck* and using the MALLOC_CHECK_ environment variable (described in mallopt(3)) cause the same kinds of errors to be detected. But, using MALLOC CHECK does not require the application to be relinked.

EXAMPLE

The program below calls $\mathbf{mcheck}()$ with a NULL argument and then frees the same block of memory twice. The following shell session demonstrates what happens when running the program:

```
$ ./a.out
About to free
About to free a second time
block freed twice
Aborted (core dumped)
```

Program source

```
#include <stdlib.h>
#include <stdio.h>
#include <mcheck.h>
int
main(int argc, char *argv[])
{
    char *p;
if (mcheck(NULL) != 0) {
    fprintf(stderr, mcheck() failedn);
    exit(EXIT_FAILURE);
}

p = malloc(1000);
fprintf(stderr, About to freen);
free(p);
fprintf(stderr, nAbout to free a second timen);
free(p);
exit(EXIT_SUCCESS);
}
```
