

NAME

sincos, sincosf, sincosl - calculate sin and cos simultaneously

SYNOPSIS

```
#define _GNU_SOURCE /* See feature\_test\_macros\(7\)
*/
#include <math.h>

void sincos(double x, double *sin, double *cos);
void sincosf(float x, float *sin, float *cos);
void sincosl(long double x, long double *sin, long double *cos);
```

Link with *-lm*.

DESCRIPTION

Several applications need sine and cosine of the same angle x . These functions compute both at the same time, and store the results in **sin* and **cos*.

If x is a NaN, a NaN is returned in **sin* and **cos*.

If x is positive infinity or negative infinity, a domain error occurs, and a NaN is returned in **sin* and **cos*.

RETURN VALUE

These functions return *void*.

ERRORS

See [math_error\(7\)](#) for information on how to determine whether an error has occurred when calling these functions.

The following errors can occur:

Domain error: x is an infinity

An invalid floating-point exception (**FE_INVALID**) is raised.

These functions do not set *errno*.

VERSIONS

These functions first appeared in glibc in version 2.1.

ATTRIBUTES

For an explanation of the terms used in this section, see [attributes\(7\)](#).

Interface	Attribute	Value
sincos() , sincosf() , sincosl()	Thread safety	MT-Safe

CONFORMING TO

These functions are GNU extensions.
