

**NAME**

Net::Domain - Attempt to evaluate the current host's internet name and domain

**SYNOPSIS**

```
use Net::Domain qw(hostfqdn hostdomain domainname);
```

**DESCRIPTION**

Using various methods **attempt** to find the Fully Qualified Domain Name (FQDN) of the current host. From this determine the host-name and the host-domain.

Each of the functions will return *undef* if the FQDN cannot be determined.

hostfqdn ()

Identify and return the FQDN of the current host.

domainname ()

An alias for hostfqdn ().

hostname ()

Returns the smallest part of the FQDN which can be used to identify the host.

hostdomain ()

Returns the remainder of the FQDN after the *hostname* has been removed.
