NAME

Pod::Simple::PullParserTextToken -- text-tokens from Pod::Simple::PullParser

SYNOPSIS

(See Pod::Simple::PullParser)

DESCRIPTION

When you do $parser->get_token on a Pod::Simple::PullParser, you might get an object of this class.

This is a subclass of Pod::Simple::PullParserToken and inherits all its methods, and adds these methods:

$token->text

This returns the text that this token holds. For example, parsing C<foo> will return a C start-token, a text-token, and a C end-token. And if you want to get the "foo" out of the text-token, call $token->text

$token->text(*somestring*)

This changes the string that this token holds. You probably won't need to do this.

$token->*text_r()*

This returns a scalar reference to the string that this token holds. This can be useful if you don't want to memory-copy the potentially large text value (well, as large as a paragraph or a verbatim block) as calling $token->text would do.

Or, if you want to alter the value, you can even do things like this:

```
 for ( ${ $token->text_r } ) { # Aliases it with $_ !!

 s/ The / the /g; # just for example

 if( 'A' eq chr(65) ) { # (if in an ASCII world)
 tr/\xA0/ /;
 tr/\xAD//d;
 }

 ...or however you want to alter the value...
 (Note that starting with Perl v5.8, you can use, e.g.,

 my $nbsp = chr utf8::unicode_to_native(0xA0);
 s/$nbsp/ /g;

 to handle the above regardless if it's an ASCII world or not)
 }
```

You're unlikely to ever need to construct an object of this class for yourself, but if you want to, call Pod::Simple::PullParserTextToken->new(*text*)
