

**NAME**

autodie::exception::system - Exceptions from autodying system().

**SYNOPSIS**

```
eval {
    use autodie qw(system);

    system($cmd, @args);

};

if (my $E = $?) {
    say "Ooops! ", $E->caller, " had problems: $@";
}
```

**DESCRIPTION**

This is a [autodie::exception](#) class for failures from the `system` command.

Presently there is no way to interrogate an [autodie::exception::system](#) object for the command, exit status, and other information you'd expect such an object to hold. The interface will be expanded to accommodate this in the future.

**stringify**

When stringified, [autodie::exception::system](#) objects currently use the message generated by `IPC::System::Simple`.
