

NAME

autodie::exception::system - Exceptions from autodying system().

SYNOPSIS

```
eval {  
    use autodie qw(system);  
  
    system($cmd, @args);  
  
};  
  
if (my $E = $?) {  
    say "Oops! ", $E->caller, " had problems: $@";  
}
```

DESCRIPTION

This is a [autodie::exception](#) class for failures from the `system` command.

Presently there is no way to interrogate an [autodie::exception::system](#) object for the command, exit status, and other information you'd expect such an object to hold. The interface will be expanded to accommodate this in the future.

stringify

When stringified, [autodie::exception::system](#) objects currently use the message generated by `IPC::System::Simple`.
