

**NAME**

CGI::Pretty - module to produce nicely formatted HTML code

**CGI::Pretty IS DEPRECATED**

It will be removed from the CGI distribution in a future release, so you should no longer use it and remove it from any code that currently uses it.

For now it has been reduced to a shell to prevent your code breaking, but the “pretty” functions will no longer output “pretty” HTML.

**Alternatives**

HTML::HTML5::Parser + HTML::HTML5::Writer + XML::LibXML::PrettyPrint:

```
use HTML::HTML5::Parser qw();
use HTML::HTML5::Writer qw();
use XML::LibXML::PrettyPrint qw();

print HTML::HTML5::Writer->new(
  start_tags => 'force',
  end_tags => 'force',
)->document(
  XML::LibXML::PrettyPrint->new_for_html( indent_string => "\t" )
->pretty_print(
  HTML::HTML5::Parser->new->parse_string( $html_string )
)
);
```

Marpa::R2::HTML (see the `html_fmt` script for examples)

HTML::Tidy
