

NAME

Git::I18N - Perl interface to Git's Gettext localizations

SYNOPSIS

```
use Git::I18N;

print __("Welcome to Git!\n");

printf __("The following error occurred: %s\n"), $error;
```

DESCRIPTION

Git's internal Perl interface to gettext via Locale::Messages. If Locale::Messages can't be loaded (it's not a core module) we provide stub passthrough fallbacks.

This is a distilled interface to gettext, see `info '(gettext)Perl'` for the full interface. This module implements only a small part of it.

FUNCTIONS

`__($)`

Locale::Messages's gettext function if all goes well, otherwise our passthrough fallback function.
