

NAME

Net::HTTP::NB - Non-blocking HTTP client

SYNOPSIS

```
use Net::HTTP::NB;
my $s = Net::HTTP::NB->new(Host => "www.perl.com") || die $@;
$s->write_request(GET => "/");

use IO::Select;
my $sel = IO::Select->new($s);

READ_HEADER: {
    die "Header timeout" unless $sel->can_read(10);
    my($code, $mess, %h) = $s->read_response_headers;
    redo READ_HEADER unless $code;
}

while (1) {
    die "Body timeout" unless $sel->can_read(10);
    my $buf;
    my $n = $s->read_entity_body($buf, 1024);
    last unless $n;
    print $buf;
}
```

DESCRIPTION

Same interface as [Net::HTTP](#) but it will never try multiple reads when the *read_response_headers()* or *read_entity_body()* methods are invoked. This make it possible to multiplex multiple [Net::HTTP::NB](#) using select without risk blocking.

If *read_response_headers()* did not see enough data to complete the headers an empty list is returned.

If *read_entity_body()* did not see new entity data in its read the value -1 is returned.
