

NAME

Win32::DBIODBC - Win32::ODBC emulation layer for the DBI

SYNOPSIS

```
use Win32::DBIODBC; # instead of use Win32::ODBC
```

DESCRIPTION

This is a *very* basic *very* alpha quality Win32::ODBC emulation for the DBI. To use it just replace

```
use Win32::ODBC;
```

in your scripts with

```
use Win32::DBIODBC;
```

or, while experimenting, you can pre-load this module without changing your scripts by doing

```
perl -MWin32::DBIODBC your_script_name
```

TO DO

Error handling is virtually non-existent.
