NAME

BIO new, BIO set, BIO free, BIO vfree, BIO free all - BIO allocation and freeing functions

SYNOPSIS

```
BIO * BIO_new(BIO_METHOD *type);
int BIO_set(BIO *a,BIO_METHOD *type);
int BIO_free(BIO *a);
void BIO_vfree(BIO *a);
void BIO_free_all(BIO *a);
```

#include <openssl/bio.h>

DESCRIPTION

The BIO new() function returns a new BIO using method type.

BIO_set() sets the method of an already existing BIO.

 $BIO_free()$ frees up a single BIO, $BIO_vfree()$ also frees up a single BIO but it does not return a value. Calling $BIO_free()$ may also have some effect on the underlying I/O structure, for example it may close the file being referred to under certain circumstances. For more details see the individual BIO METHOD descriptions.

 $BIO_free_all()$ frees up an entire BIO chain, it does not halt if an error occurs freeing up an individual BIO in the chain.

RETURN VALUES

BIO_new() returns a newly created BIO or NULL if the call fails.

BIO_set(), BIO_free() return 1 for success and 0 for failure.

BIO free all() and BIO vfree() do not return values.

NOTES

Some BIOs (such as memory BIOs) can be used immediately after calling $BIO_new()$. Others (such as file BIOs) need some additional initialization, and frequently a utility function exists to create and initialize such BIOs.

If BIO_free() is called on a BIO chain it will only free one BIO resulting in a memory leak.

Calling $BIO_free_all()$ a single BIO has the same effect as calling $BIO_free()$ on it other than the discarded return value.

Normally the **type** argument is supplied by a function which returns a pointer to a BIO_METHOD. There is a naming convention for such functions: a source/sink BIO is normally called BIO_s_*() and a filter BIO BIO_f_*();

EXAMPLE

```
Create a memory BIO:
```

```
BIO *mem = BIO_new(BIO_s_mem());
```
