

**NAME**

`CMS_verify_receipt` - verify a CMS signed receipt

**SYNOPSIS**

```
#include <openssl/cms.h>
```

```
int CMS_verify_receipt(CMS_ContentInfo *rcms, CMS_ContentInfo *ocms, STACK_OF(X509)
```

**DESCRIPTION**

`CMS_verify_receipt()` verifies a CMS signed receipt. **rcms** is the signed receipt to verify. **ocms** is the original SignedData structure containing the receipt request. **certs** is a set of certificates in which to search for the signing certificate. **store** is a trusted certificate store (used for chain verification).

**flags** is an optional set of flags, which can be used to modify the verify operation.

**NOTES**

This functions behaves in a similar way to `CMS_verify()` except the flag values `CMS_DETACHED`, `CMS_BINARY`, `CMS_TEXT` and `CMS_STREAM` are not supported since they do not make sense in the context of signed receipts.

**RETURN VALUES**

`CMS_verify_receipt()` returns 1 for a successful verification and zero if an error occurred.

The error can be obtained from [ERR\\_get\\_error\(3\)](#)
