

NAME

CONF_modules_free, CONF_modules_finish, CONF_modules_unload -
OpenSSL configuration cleanup functions

SYNOPSIS

```
#include <openssl/conf.h>
```

```
void CONF_modules_free(void);  
void CONF_modules_finish(void);  
void CONF_modules_unload(int all);
```

DESCRIPTION

CONF_modules_free() closes down and frees up all memory allocated by all configuration modules.

CONF_modules_finish() calls each configuration modules **finish** handler to free up any configuration that module may have performed.

CONF_modules_unload() finishes and unloads configuration modules. If **all** is set to **0** only modules loaded from DSOs will be unloads. If **all** is **1** all modules, including builtin modules will be unloaded.

NOTES

Normally applications will only call *CONF_modules_free()* at application to tidy up any configuration performed.

RETURN VALUE

None of the functions return a value.
