

**NAME**

CONF\_modules\_free, CONF\_modules\_finish, CONF\_modules\_unload -  
OpenSSL configuration cleanup functions

**SYNOPSIS**

```
#include <openssl/conf.h>

void CONF_modules_free(void);
void CONF_modules_finish(void);
void CONF_modules_unload(int all);
```

**DESCRIPTION**

*CONF\_modules\_free()* closes down and frees up all memory allocated by all configuration modules.

*CONF\_modules\_finish()* calls each configuration modules **finish** handler to free up any configuration that module may have performed.

*CONF\_modules\_unload()* finishes and unloads configuration modules. If **all** is set to **0** only modules loaded from DSOs will be unloads. If **all** is **1** all modules, including builtin modules will be unloaded.

**NOTES**

Normally applications will only call *CONF\_modules\_free()* at application to tidy up any configuration performed.

**RETURN VALUE**

None of the functions return a value.

**SEE ALSO**

**HISTORY**

*CONF\_modules\_free()*, *CONF\_modules\_unload()*, and *CONF\_modules\_finish()* first appeared in OpenSSL 0.9.7.
