#### NAME

ERR\_GET\_LIB, ERR\_GET\_FUNC, ERR\_GET\_REASON - get library, function and reason code

# SYNOPSIS

```
#include <openssl/err.h>
int ERR_GET_LIB(unsigned long e);
int ERR_GET_FUNC(unsigned long e);
int ERR_GET_REASON(unsigned long e);
```

#### **DESCRIPTION**

The error code returned by  $ERR\_get\_error()$  consists of a library number, function code and reason code.  $ERR\_GET\_LIB()$ ,  $ERR\_GET\_FUNC()$  and  $ERR\_GET\_REASON()$  can be used to extract these.

The library number and function code describe where the error occurred, the reason code is the information about what went wrong.

Each sub-library of OpenSSL has a unique library number; function and reason codes are unique within each sub-library. Note that different libraries may use the same value to signal different functions and reasons.

**ERR\_R\_m** reason codes such as **ERR\_R\_MALLOC\_FAILURE** are globally unique. However, when checking for sub-library specific reason codes, be sure to also compare the library number.

ERR GET LIB(), ERR GET FUNC() and ERR GET REASON() are macros.

## RETURN VALUES

The library number, function code and reason code respectively.

## SEE ALSO

```
err(3), ERR get error(3)
```

## **HISTORY**

 $ERR\_GET\_LIB()$ ,  $ERR\_GET\_FUNC()$  and  $ERR\_GET\_REASON()$  are available in all versions of SSLeay and OpenSSL.
