

**NAME**

EVP\_PKEY\_new, EVP\_PKEY\_free - private key allocation functions.

**SYNOPSIS**

```
#include <openssl/evp.h>

EVP_PKEY *EVP_PKEY_new(void);
void EVP_PKEY_free(EVP_PKEY *key);
```

**DESCRIPTION**

The *EVP\_PKEY\_new()* function allocates an empty **EVP\_PKEY** structure which is used by OpenSSL to store private keys.

*EVP\_PKEY\_free()* frees up the private key **key**.

**NOTES**

The **EVP\_PKEY** structure is used by various OpenSSL functions which require a general private key without reference to any particular algorithm.

The structure returned by *EVP\_PKEY\_new()* is empty. To add a private key to this empty structure the functions described in [\*EVP\\_PKEY\\_set1\\_RSA\(3\)\*](#) should be used.

**RETURN VALUES**

*EVP\_PKEY\_new()* returns either the newly allocated **EVP\_PKEY** structure or **NULL** if an error occurred.

*EVP\_PKEY\_free()* does not return a value.
