

NAME

radeon - ATI/AMD RADEON video driver

SYNOPSIS

Section "Device"

Identifier "*devname*"

Driver "radeon"

...

EndSection

DESCRIPTION

radeon is an Xorg driver for ATI/AMD RADEON-based video cards with the following features:

- Full support for 8-, 15-, 16- and 24-bit pixel depths;
- RandR 1.2 and RandR 1.3 support;
- Full EXA 2D acceleration;
- Textured XVideo acceleration including anti-tearing support (Bicubic filtering only available on R/RV3xx, R/RV/RS4xx, R/RV5xx, and RS6xx/RS740);
- 3D acceleration;

SUPPORTED HARDWARE

The **radeon** driver supports PCI, AGP, and PCIe video cards based on the following ATI/AMD chips (note: list is non-exhaustive):

R100	Radeon 7200
RV100	Radeon 7000(VE), M6, RN50/ES1000
RS100	Radeon IGP320(M)
RV200	Radeon 7500, M7, FireGL 7800
RS200	Radeon IGP330(M)/IGP340(M)
RS250	Radeon Mobility 7000 IGP
R200	Radeon 8500, 9100, FireGL 8800/8700
RV250	Radeon 9000PRO/9000, M9
RV280	Radeon 9200PRO/9200/9200SE/9250, M9+
RS300	Radeon 9100 IGP
RS350	Radeon 9200 IGP
RS400/RS480	Radeon XPRESS 200(M)/1100 IGP
R300	Radeon 9700PRO/9700/9500PRO/9500/9600TX, FireGL X1/Z1
R350	Radeon 9800PRO/9800SE/9800, FireGL X2
R360	Radeon 9800XT
RV350	Radeon 9600PRO/9600SE/9600/9550, M10/M11, FireGL T2
RV360	Radeon 9600XT
RV370	Radeon X300, M22
RV380	Radeon X600, M24
RV410	Radeon X700, M26 PCIe
R420	Radeon X800 AGP
R423/R430	Radeon X800, M28 PCIe
R480/R481	Radeon X850 PCIe/AGP
RV505/RV515/RV516/RV550	Radeon X1300/X1400/X1500/X1550/X2300
R520	Radeon X1800
RV530/RV560	Radeon X1600/X1650/X1700
RV570/R580	Radeon X1900/X1950
RS600/RS690/RS740	Radeon X1200/X1250/X2100

R600	Radeon HD 2900
RV610/RV630	Radeon HD 2400/2600/2700/4200/4225/4250
RV620/RV635	Radeon HD 3410/3430/3450/3470/3650/3670
RV670	Radeon HD 3690/3850/3870
RS780/RS880	Radeon HD 3100/3200/3300/4100/4200/4250/4290
RV710/RV730	Radeon HD 4330/4350/4550/4650/4670/5145/5165/530v/545v/560v/565v
RV740/RV770/RV790	Radeon HD 4770/4730/4830/4850/4860/4870/4890
CEDAR	Radeon HD 5430/5450/6330/6350/6370
REDWOOD	Radeon HD 5550/5570/5650/5670/5730/5750/5770/6530/6550/6570
JUNIPER	Radeon HD 5750/5770/5830/5850/5870/6750/6770/6830/6850/6870
CYPRESS	Radeon HD 5830/5850/5870
HEMLOCK	Radeon HD 5970
PALM	Radeon HD 6310/6250
SUMO/SUMO2	Radeon HD 6370/6380/6410/6480/6520/6530/6550/6620
BARTS	Radeon HD 6790/6850/6870/6950/6970/6990
TURKS	Radeon HD 6570/6630/6650/6670/6730/6750/6770
CAICOS	Radeon HD 6430/6450/6470/6490
CAYMAN	Radeon HD 6950/6970/6990
ARUBA	Radeon HD 7000 series
TAHITI	Radeon HD 7900 series
PITCAIRN	Radeon HD 7800 series
VERDE	Radeon HD 7700 series
OLAND	Radeon HD 8000 series
HAINAN	Radeon HD 8000 series
BONAIRE	Radeon HD 7790 series
KAVERI	KAVERI APUs
KABINI	KABINI APUs
HAWAII	Radeon R9 series
MULLINS	MULLINS APUs

CONFIGURATION DETAILS

Please refer to [xorg.conf\(5\)](http://xorg.conf(5)) for general configuration details. This section only covers configuration details specific to this driver.

The following driver **Options** are supported:

Option "SWcursor" "boolean"

Selects software cursor. The default is **off**.

Option "Accel" "boolean"

Enables or disables all hardware acceleration.
The default is **on**.

Option "ZaphodHeads" "string"

Specify the RandR output(s) to use with zaphod mode for a particular driver instance. If you use this option you must use this option for all instances of the driver.

For example: **Option "ZaphodHeads" "LVDS,VGA-0"** will assign xrandr outputs LVDS and VGA-0 to this instance of the driver.

Option "ColorTiling" "boolean"

The framebuffer can be addressed either in linear or tiled mode. Tiled mode can provide significant performance benefits with 3D applications. Tiling will be disabled if the drm module is too

old or if the current display configuration does not support it. On R600+ this enables 1D tiling mode.

The default value is **on** for R/RV3XX, R/RV4XX, R/RV5XX, RS6XX, RS740, R/RV6XX, R/RV7XX, RS780, RS880, EVERGREEN, CAYMAN, ARUBA, Southern Islands, and Sea Islands and **off** for R/RV/RS1XX, R/RV/RS2XX, RS3XX, and RS690/RS780/RS880 when fast fb feature is enabled.

Option "ColorTiling2D" "boolean"

The framebuffer can be addressed either in linear, 1D, or 2D tiled modes. 2D tiled mode can provide significant performance benefits over 1D tiling with 3D applications. Tiling will be disabled if the drm module is too old or if the current display configuration does not support it. KMS ColorTiling2D is only supported on R600 and newer chips and requires Mesa 9.0 or newer for R6xx-ARUBA, Mesa 9.2 or newer for Southern Islands, and Mesa 10.1 or newer for Sea Islands.

The default value is **on** for R/RV6XX, R/RV7XX, RS780, RS880, EVERGREEN, CAYMAN, ARUBA, Southern Islands, and Sea Islands.

Option "DRI" "integer"

Define the maximum level of DRI to enable. Valid values are 2 for DRI2 or 3 for DRI3. The default is **3 for DRI3** if the Xorg version is $\geq 1.18.3$ and glamor is enabled, otherwise **2 for DRI2**. **Note:** DRI3 may not work correctly in all cases with EXA, enable at your own risk.

Option "EnablePageFlip" "boolean"

Enable DRI2 page flipping. The default is **on**. Pageflipping is supported on all radeon hardware.

Option "TearFree" "boolean"

Enable tearing prevention using the hardware page flipping mechanism. Requires allocating two separate scanout buffers for each CRTC. Enabling this option currently disables Option "EnablePageFlip". The default is **off**.

Option "AccelMethod" "string"

Chooses between available acceleration architectures. Valid values are **EXA** (for pre-TAHITI GPUs) and **glamor** (for R300 or higher). The default is **glamor** as of TAHITI, otherwise **EXA**.

The following driver **Options** are supported for **glamor** :

Option "ShadowPrimary" "boolean"

This option enables a so-called "shadow primary" buffer for fast CPU access to pixel data, and separate scanout buffers for each display controller (CRTC). This may improve performance for some 2D workloads, potentially at the expense of other (e.g. 3D, video) workloads. Note in particular that enabling this option currently disables page flipping. The default is **off**.

The following driver **Options** are supported for **EXA** :

Option "EXAVSync" "boolean"

This option attempts to avoid tearing by stalling the engine until the display controller has passed the destination region. It reduces tearing at the cost of performance and has been known to cause instability on some chips. The default is **off**.

Option "EXAPixmaps" "boolean"

Under KMS, to avoid thrashing pixmaps in/out of VRAM on low memory cards, we use a heuristic based on VRAM amount to determine whether to allow EXA to use VRAM for non-essential pixmaps. This option allows us to override the heuristic. The default is **on** with $> 32\text{MB}$ VRAM, **off** with $< 32\text{MB}$ or when fast fb feature is enabled for RS690/RS780/RS880.

Option "SwapbuffersWait" "boolean"

This option controls the behavior of glXSwapBuffers and glXCopySubBufferMESA calls by GL applications. If enabled, the calls will avoid tearing by making sure the display scanline is outside of the area to be copied before the copy occurs. If disabled, no scanline synchronization is performed, meaning tearing will likely occur. Note that when enabled, this option can adversely affect the framerate of applications that render frames at less than refresh rate.

The default value is **on**.

TEXTURED VIDEO ATTRIBUTES

The driver supports the following X11 Xv attributes for Textured Video. You can use the "xvattr" tool to query/set those attributes at runtime.

XV_VSYNC

XV_VSYNC is used to control whether textured adapter synchronizes the screen update to the monitor vertical refresh to eliminate tearing. It has two values: 'off'(0) and 'on'(1). The default is **'on'(1)**.

XV_CRTC

XV_CRTC is used to control which display controller (crtc) the textured adapter synchronizes the screen update with when XV_VSYNC is enabled. The default, 'auto'(-1), will sync to the display controller that more of the video is on; when this is ambiguous, the display controller associated with the RandR primary output is preferred. This attribute is useful for things like clone mode where the user can best decide which display should be synced. The default is **'auto'(-1)**.

XV_BICUBIC

XV_BICUBIC is used to control whether textured adapter should apply a bicubic filter to smooth the output. It has three values: 'off'(0), 'on'(1) and 'auto'(2). 'off' means never apply the filter, 'on' means always apply the filter and 'auto' means apply the filter only if the X and Y sizes are scaled to more than double to avoid blurred output. Bicubic filtering is not currently compatible with other Xv attributes like hue, contrast, and brightness, and must be disabled to use those attributes. The default is **'off'(0)**.
