

**NAME**

sysctl.conf - sysctl preload/configuration file

**DESCRIPTION**

**sysctl.conf** is a simple file containing sysctl values to be read in and set by **sysctl**. The syntax is simply as follows:

```
# comment
; comment

token = value
```

Note that blank lines are ignored, and whitespace before and after a token or value is ignored, although a value can contain whitespace within. Lines which begin with a # or ; are considered comments and ignored.

**EXAMPLE**

```
# sysctl.conf sample
#
kernel.domainname = example.com
; this one has a space which will be written to the sysctl!
kernel.modprobe = /sbin/mod probe
```

**FILES**

```
/run/sysctl.d/*.conf
/etc/sysctl.d/*.conf
/usr/local/lib/sysctl.d/*.conf
/usr/lib/sysctl.d/*.conf
/lib/sysctl.d/*.conf
/etc/sysctl.conf
```

The paths where sysctl preload files usually exist. See also sysctl option *--system*.
