

**NAME**

checkgid - checks the gid

**SYNOPSIS**

**checkgid** group

**DESCRIPTION**

This manual page documents briefly the **checkgid** command.

**checkgid** is a program that checks whether it can setgid to the group specified. This is to see if it is a valid group for apache2 to use at runtime. If the user (should be run as superuser) is in that group, or can setgid to it, it will return 0.

**AUTHOR**

This manual page was written by Daniel Stone <daniel@sfarc.net> for the Debian GNU/Linux distribution, as the original did not have a manpage.
