NAME

ematch - extended matches for use with basic or flow filters

SYNOPSIS

tc filter add .. basic match EXPR **.. flowid ..**

EXPR := *TERM* [{ **and** | **or** } *EXPR*]

TERM := [**not**] { *MATCH* | '(' *EXPR* ')' }

MATCH := *module* '(' *ARGS* ')'

ARGS := *ARG1 ARG2* ..

MATCHES

cmp

Simple comparison ematch: arithmetic compare of packet data to a given value.

cmp(*ALIGN* at *OFFSET* [*ATTRS*] { *eq* | *lt* | *gt* } *VALUE*)

ALIGN := { *u8* | *u16* | *u32* }

ATTRS := [layer *LAYER*] [mask *MASK*] [trans]

LAYER := { *link* | *network* | *transport* | *0..2* }

meta

Metadata ematch

meta(*OBJECT* { *eq* | *lt* |*gt* } *OBJECT*)

OBJECT := { *META_ID* | *VALUE* }

META_ID := *id* [shift *SHIFT*] [mask *MASK*]

meta attributes:

random 32 bit random value

loadavg_1 Load average in last 5 minutes

nf_mark Netfilter mark

vlan Vlan tag

sk_rcvbuf Receive buffer size

sk_snd_queue Send queue length

A full list of meta attributes can be obtained via

tc filter add dev eth1 basic match 'meta(list)'

nbyte

match packet data byte sequence

nbyte(*NEEDLE* at *OFFSET* [layer *LAYER*])

NEEDLE := { *string* | *c-escape-sequence* }

OFFSET := *int*

LAYER := { *link* | *network* | *transport* | *0..2* }

u32

u32 ematch

u32(*ALIGN VALUE MASK* at [nexthdr+] *OFFSET*)

ALIGN := { *u8* | *u16* | *u32* }

ipset

test packet against ipset membership

ipset(*SETNAME FLAGS*)

SETNAME := *string*

FLAGS := { *FLAG* [, *FLAGS*] }

The flag options are the same as those used by the iptables set match.

When using the ipset ematch with the ip_set_hash:net,iface set type, the interface can be queried using src,dst (source ip address, outgoing interface) or src,src (source ip address, incoming interface) syntax.

CAVEATS

The ematch syntax uses '(' and ')' to group expressions. All braces need to be escaped properly to prevent shell commandline from interpreting these directly.

When using the ipset ematch with the ifb device, the outgoing device will be the ifb device itself, e.g. ifb0. The original interface (i.e. the device the packet arrived on) is treated as the incoming interface.

EXAMPLE & USAGE

tc filter add .. basic match ...

'cmp(u16 at 3 layer 2 mask 0xff00 gt 20)'

'meta(nfmark gt 24)' and 'meta(tcindex mask 0xf0 eq 0xf0)'

'nbyte(ababa at 12 layer 1)'

'u32(u16 0x1122 0xffff at nexthdr+4)'

Check if packet source ip address is member of set named **bulk**:

'ipset(bulk src)'

Check if packet source ip and the interface the packet arrived on is member of hash:net,iface set named **interactive**:

'ipset(interactive src,src)'

AUTHOR

The extended match infrastructure was added by Thomas Graf.
