

NAME

`fstab-decode` - run a command with fstab-encoded arguments

SYNOPSIS

`fstab-decode` *COMMAND* [*ARGUMENT*]...

DESCRIPTION

`fstab-decode` decodes escapes in the specified *ARGUMENT*s and uses them to run *COMMAND*. The argument escaping uses the same rules as path escaping in `/etc/fstab`, `/etc/mstab` and `/proc/mstab`.

EXIT STATUS

`fstab-decode` exits with status 127 if *COMMAND* can't be run. Otherwise it exits with the status returned by *COMMAND*.

EXAMPLES

`fstab-decode umount $(awk '$3 == vfat { print $2 }' /etc/fstab)`
