

NAME

pma-configure - enables configuration of phpMyAdmin installation

SYNOPSIS

pma-configure

DESCRIPTION

pma-configure changes permissions on the configuration file of phpMyAdmin, so that the setup script (usually installed as [<http://localhost/phpmyadmin/setup/index.php>](http://localhost/phpmyadmin/setup/index.php)) can write to it.

Please note that having the system in this state may be insecure. Remember to run [pma-secure\(8\)](#) after you are done with configuration.

OPTIONS

This program does not accept any command line parameters.
