

NAME

postfix-add-filter - add filter service to Postfix master.cf

SYNOPSIS

postfix-add-filter [*smtp service name...*] [*smtpd port...*]

DESCRIPTION

The **postfix-add-filter(8)** command adds an smtp service named *smtp service name* and an smtpd server listening on *smtpd port* to *etc/postfix/master.cf* to facilitate integration of SMTP filters such as amavisd-new or clamsmtp. The configuration is based on the upstream recommendations for amavisd-new 2.6.0. Administrators should verify it is appropriate for their requirements.

The original file is copied prior to modification and left in */etc/postfix* to make it possible to revert changes easily.

Available in the Debian package for Postfix version 2.5.3 and later.

DIAGNOSTICS

If the given *smtp service name* or *smtpd port* already appear in the *master.cf*, a message will be printed to standard out and *master.cf* will not be modified.

ENVIRONMENT**MAIL_CONFIG**

Directory with Postfix configuration files.

The **postfix-add-filter(8)** command should use this, but it currently doesn't. It is hard coded to */etc/postfix*. This should be changed.

CONFIGURATION PARAMETERS

None

FILES

/etc/postfix/master.cf
